

Ultrasonically Assisted Fitness Method And Apparatus

Published date: April 20, 2014

Technology description

A device for accelerating the loss of regional body fat tissue in an exercising person, which includes a plurality of ultrasonic transducers for emitting ultrasound, and an implement for containing the transducers which is positioned proximate to the regional body fat tissue in the exercising person. The device includes means for controlling the transducers, whereby said ultrasound enhances the loss of the regional body fat tissue in the exercising person when the device is positioned proximate the regional body fat tissue and ultrasound is admitted thereto.
