

One-sided adjusting double-sided forceps

Published date: Jan. 14, 2015

Technology description

Introduction

The invention belongs to the field of dental instruments.

AJUSTE OCLUSAL constitutes an important dentition procedure, providing the necessary conditions for the neuromuscular system and the health of the temporomandibular joint (TMJ), seeking to improve the functional relationship of dentition in order to receive uniform physiological stimulation with the supporting periodontal ligament.

Objective

In order to solve the problems existing in the occlusal adjustment of the existing instruments on the market, BILATERAL is designed to handle two retainers simultaneously with only one hand, so that the professionals of the other hand can position the jaw to the correct occlusion more freely, thus avoiding errors in the execution process.

Application area

Professional dental surgeon;

Dental specialists (dentists and professionals);

- Students in dental courses.
