

Lupus Nephritis Diagnostic Biomarker Panel

Published date: Oct. 13, 2011

Technology description

Four renal biomarkers: transferrin (TF), ceruloplasmin (Cp), lipocalin-type prostaglandin-D synthetase (L-PGDS), and alpha-1-acid glycoprotein (AGP), are capable of accurately diagnosing and determining the course of LN in both children and adults with systemic lupus erythematosus (SLE). While each individual biomarker can be used alone, the combination of two or more of these biomarkers improves diagnostic capability.
