

Videolaryngoscope

Published date: Nov. 30, 2018

Technology description

The video laryngoscope is an instrument used for endotracheal intubation that captures the direct image of the airway through a video device and a light source that helps health professionals to have a better performance in the handling of the respiratory tract improving patient comfort and decreasing potential risks. It has two channels: a working channel that allows the entry of other medical devices, such as suction devices; and another channel designed for the oxygenation of the patient, allowing the entry of an endotracheal guide and an endotracheal tube.
