Method and system for generating semantic visual templates for image and video retrieval

Published date: Feb. 17, 2012

Technology description

Summary

A computerized system and method for querying a video database for a concept using a subset of a natural language in conjunction with semantic visual templates are described. Techniques which facilitate access to database items are also described.

The method and system comprises of a means for obtaining a textual query. The query is parsed to generate visual attributes. The visual attributes are used for forming a visual query which is used to retrieve information. A display device displays the information.

The method and system provide techniques using which related images can be retrieved based on the image given as an input by the user.
